Read the passage carefully and answer the questions given below: (Q. 76 – Q. 81)

The Walt Disney Company became the first major media company to ban advertisements for candy bars and junk food on its television channels, radio stations and websites, to stop food manufacturers from peddling nutritionally challenged fattening junk for kids. The ban covers foods with too much sugar, too much salt or a full meal more than 600 calories. Predictably, the outraged public said that banning smoking in public places and artery – blocking Tran's fats in food in food was bad enough, but stopping them from guzzling comfort drinks by the litres was almost a human rights violation.

It seems most people are not just happy choosing their own poison. They also want it in super- sized doses, guaranteed to kill sooner than later, for after tobacco use, obesity is the biggest public health bugbear that triggers more avoidable diseases and deaths than malnutrition. Overweight and obesity are the leading causes for global deaths, killing 2.8 million adults each year. Worldwide obesity has more than doubled since 1980. The reasons for poor lifestyle choices are many, with almost all driven by socio – economic causes such as low education and limited income. Like killer infections, obesity and the resultant type – 2 diabetes affect the poor more than the affluent, largely because processed and fast food are cheaper and less or no time to prepare than healthy home – cooked meals. Limiting food choices, however, I not enough.

The need is to get children off their chairs and into the playgrounds. Too much screen time, largely social – networking followed by online and video gaming and television are making healthy children fat and putting them at risk of type – 2 diabetes in the second decade of their lives. The lifestyle disease that interferes with the way the body metabolizes glucose typically affects people in their fifties and sixties and is linked with a host of complications.

The official measure of obesity in adults is Body Mass Index (BMI), which is calculated by dividing a person's weight in kilograms by the square of his height in metres (kg/m^2). The WHO definition is a BMI greater than or equal to 25 is overweight, 30 is obese, but the cutoffs for the South Asians are 23 for overweight and 25 for obese.
